

ABSTRACT OF THE DISCLOSURE

A trailer storage rack for transporting material and fluids with a livestock trailer. The trailer storage rack mounts to the livestock trailer to transfer the weight and forces of operation to the trailer. The storage rack may be spaced above the trailer to allow for the use of trailer roof vents. An open compartment, dry storage
5 compartment and a fluid compartment are described. Loading and unloading means for the open and dry storage compartment include a rotatable lifting crane that may be compacted and stored in the storage compartment. Access for filling and the draining the fluid compartment is provided by connecting the fluid compartment to
10 side conduits of a ladder such that the side conduits of the ladder act as pipes connected to the fluid compartment. A water hose connection valve is attached to the conduits for access at the ground level to provide easy access for filling and draining the fluid storage compartment.
